

Work Cosmetic, stimulation of the fibroblast including stimulation collagen & hyaluronic acid.

Would you like to look toward future of antiage programs?

The scientific research revealed novel cellular pathways and deepen our understanding of skin stimulation for antiage purposes through the fibroblasts activation.

Fibroblast cells play an important role **for deep stimulation that targets fine lines & wrinkles at their origin** helping skin improving and maintaining skin firmness and tightness because they secrete collagen proteins and intervenes on the extracellular matrix that help maintain the structural framework of tissues.

Until now in the beauty sector there are several methods to obtain the skin stimulation, cosmetics, invasive technologies, injections...but only one non invasive method: the manual massage one.

Finally the Swiss research provide the beauticians and cosmetologists with a cutting edge and not invasive technology for antiage purposes: Vibra Beauty.

Vibra Beauty is a technology that emits gentle selective and focal air vibrations.

These mechanical force at the specific frequency of 100 Hz provides the crucial effect on fibroblast behavior as the cells' migration promoting in the acceleration of all their activities.

Fibroblasts are responsible for collagen synthesis, as well as the production of proteoglycans and glycosaminoglycans (hyaluronic acid, major components of the extracellular matrix that help to stabilize and form a scaffold.

So the power of vibrations is able to restore normal composition of the connective tissue where in maintaining the degree of hydration, turgidity, viscosity and plasticity as in this sort of scaffolding that allows the tissue to maintain its healthy and attractive tone and hydration.

The vibrations also boost circulation, increasing skin's oxygen uptake, which makes you glow. Overall it helps skin appear firmer and more contoured.
